

Sample questions for CO1 – Assessment Tool 3 – Short Answer Test

1. Define cloud computing and explain any four characteristics that make it different from traditional on-premise computing
2. Trace the evolution of cloud computing from hardware evolution to internet software evolution, and show how these changes enabled modern cloud platforms
3. Explain the role of server virtualization in cloud computing. Differentiate between virtualization as an enabling technology and cloud computing as a service model
4. Discuss the role of **data centers** in delivering cloud services
5. Differentiate IaaS, PaaS, SaaS, and XaaS with one suitable real-world example for each model

1A) cloud computing: cloud computing is the way of providing like cloud services, power's, GPU network etc... through over an internet is cloud computing.

characteristics of cloud computing

* AS-pay-as-you: The user can be used like required amount much they use.

* Elasticity: The server's can be maintained as schedule up and down as user required at busy times.

* Access: The user can be accessible to server from anywhere across like authentication process.

eg:- user → Thailand;

* cloud collaboration: AS cloud user can provide extra exercise, but instead of buying new server collab with any other cloud partner to improve scalability.

difference of cloud & on premise computing

* cloud: It can store data and other etc.

* on premise computing: on premise computing same as cloud computing

2A) Evolution of cloud computing:

* Early time cloud [1980's]

* The thing is where the computer is characterised and used together which is very large to one from another.

* client server [1990's]

* The application work on computer is managed in between client's and server.

* Here they use RAM and to store data from clients.

* Software Evaluation [2000's]

* The software are created which is accessible to internet through all over world.

* server improvement [2010's]

* server is made up of data that can run by companies and groups etc.

* Improved scalability & Reliable

* In all we can see time change we enabled modern platform clouds

* And also it can improve scalability & Reliable in cloud computing.

3A) Server: It is a server that helps in store's the data and perform on the Applications.

* virtualization: It is method of creating virtual machines or many from other's.

differences:

server
virtualization

cloud
computing

* It creates multiple virtual hardware on server's.

* It is technology

* It helps in improve more storage network.

* This works on using hardware.

* cloud can accesible over all internet.

* It stores data.

* cloud computing can provide more storage.

* In above table we can see differences between server virtualization & cloud computing.

* And also role of server virtualization in cloud computing.

- 4A) data centers: The main data center is delivering cloud services.
- * Data centers provides internet & data to servers.
 - * It can be installed all over places.

Role of data center

- * now-a-days cloud is made as-you-pay and data.
- * Data centers are very useful to all services.
- * It is very important to all cloud services.
- * It is available anywhere in locations.
- * Data centers play crucial role in cloud computing.
- * And also cloud services.
- * Data centers provide internet for all services.
- * Data center delivers cloud services.
- * All data center provide internet.
- * So data center play role in and deliver's cloud services.

5A) The cloud is classified into four main services

1) IaaS

2) PaaS

3) SaaS

4) XaaS

1) ^{Infrastructure} Information as a service:

* cloud can provide infrastructure without user creation.

Eg:- OS, virtualization

2) PaaS :- Platform as a service:

* It provides a platform where all users can access all.

Eg:- google search engine, browser

3) SaaS :- Software as a service:

* It provides software for free limited Authorization.

Eg:- gmail, 365 office

4) XaaS :- Anything as a service

* All requirements like CPU, GPU, storage, network, power etc.

Eg:- Azure, AWS
